## Discerning Inter-Entity Relationships

SSTYPE

13

PERSON

ORGANIZATION

EMPLOYEE

SHAREHOLDER

CUSTOMER

VENDOR

Construct a high-level, conceptual data model.

*Problems?*

*Observations?*

N

E

## A Fundamental Assumption in a Data Model Diagram

SSTYPE

14

- The main construct is an Entity.
- Each labeled box/circle represents an Entity Type
  - a Defined Structure (a schema template)
  - a Population of Instances
- Grouping Instances into Types is essentially Arbitrary.
  - The world isn't naturally that way; the designer imposes a view
- All Entity Type Populations are strictly Disjoint (mutually exclusive; or non-overlapping).
  - At least that is the system's assumption, thus each file/table has its own set of records/tuples.

*Is this always true?*

*What about:*

EMPLOYEE

SHAREHOLDER

⊆

## Using Subtypes and Supertypes

SSTYPE
Smith & Smith, ACM TODS, 1977/6.

15

- Subtypes and Supertypes allow us to formally represent overlapping populations
  - Every member of a subtype population **is-a** member of its supertype population(s).

so we can model:

- different roles played by members of a common population, e.g.:
  - role determines the attributes
- different states of an entity (over time), e.g.:

```

            graph BT
            EMPLOYEE --> PERSON
            SHAREHOLDER --> PERSON
            CUSTOMER --> PERSON
            ORGANIZATION --> PERSON
            style ORGANIZATION stroke:#f00,stroke-width:2px
            
```

ORDER

```

            graph LR
            A[ORDER RECEIVED] -.-> B[ORDER VALIDATED & ACCEPTED]
            B -.-> C[ORDER FILLED]
            C -.-> D[BACK ORDER]
            D -.-> E[ORDER REJECTED]
            A -.-> E
            B -.-> E
            
```

⊆

## Subtype-Supertype "Relationship"

SSTYPE

16

- Tempting to call it a "Relationship"

```

            graph LR
            S([Supertype]) ---|1:1| T([Subtype])
            S -.-> T
            
```

- $\text{pop}(\text{subtype}) \subseteq \text{pop}(\text{supertype})$
- AND the related members in the two sets are the **same** instance
  - that is what makes it different from relationships in a traditional ER/Relational data model, where the entity type populations are (assumed) disjoint!

© Gordon C. Everest, All rights reserved.

## Generalization / Specialization

SSTYPE

17 **Forming Entity Types**

- Fundamentally an “arbitrary” choice made by the DB Designer
- Recognizing when to use Subtypes and Supertypes
- Think about the entity *populations* you are modeling

**Two basic and distinct situations:**

- **Generalization:** (bottom-up - from several to a common supertype)
  - When you observe commonalities (e.g., common attributes\*) across multiple entity populations.
  - the members may actually be from the same population, the same type of ‘thing’, so define a common supertype.
- **Specialization:** (top-down - from one to subtypes)
  - When there is something special about a subset of a population
    - They have some unique attributes\*
    - You want to treat them differently
      - e.g., Apply a constraint, or have some attributes mandatory

\*NOTE: speaking of attributes in ORM, means roles in relationships with other objects.

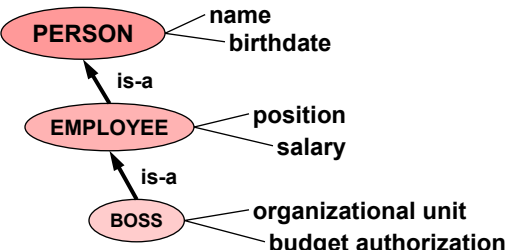

## Subtypes and Supertypes

SSTYPE

18 **TWO CONDITIONS MUST ALWAYS BE TRUE:**

- each subtype population must be a **subset** (potentially) of each of its supertype populations  
i.e., each instance of the subtype is in every supertype population
- each subtype inherits **all** the roles of its supertypes **and** must have **additional roles/relationships**

```

graph BT
    BOSS((BOSS)) -- is-a --> EMPLOYEE((EMPLOYEE))
    EMPLOYEE -- is-a --> PERSON((PERSON))
    PERSON --- name
    PERSON --- birthdate
    EMPLOYEE --- position
    EMPLOYEE --- salary
    BOSS --- orgunit[organizational unit]
    BOSS --- budget[budget authorization]
          
```

↑ More Instances  
(larger population)

↓ More Attributes  
/Roles  
/Relationships

**If either condition is NOT true,  
no reason to call out the subtype in a separate definition.**

## Diagramming Subtypes and Supertypes

SSTYPE

19 Two Basic Representations:

### 1. NESTED (Euler Diagram)

- + Intuitive - visually shows inclusion
- + Clean and Compact
- Only good for simple cases
- generally assumed disjoint
- Not good for complex cases - difficult to represent both exclusive and overlapping subtypes (like a Venn Diagram):

## Diagramming Subtypes and Supertypes

SSTYPE

20 Two Basic Representations:

### 2. SEPARATED

- + More common
- + Easier to show constraints and multiple supertypes for more complex cases.
- not visually intuitive
- confusion with "relationship"
- Adds more "clutter"

ORM, UML

EER

IE

IDEF1X

⊞

## Diagramming Exercise

SSTYPE

21 • **Convert the following Nested diagram into a Separated S/Type diagram:**

*How to model 'E' ?*

*Any constraints required?*

⊞

## Subtype / Supertype Constraints

SSTYPE

22 **IN GENERAL, WITHOUT CONSTRAINTS, ASSUME:**

- **overlapping subtype populations**
  - else **Disjoint**, so apply **Exclusion** constraint:
- **non-exhaustive (Partial) on the supertype**,  
i.e., a supertype instance need not be in any subtype
  - else **Mandatory/Totality/Dependency** constraint

**=> Declare constraints on the more restrictive cases**

- **Some systems allow only Disjoint and Total**
  - it is possible to model Overlapping, even if the system only allows Disjoint subtypes.
- **Some systems make Disjoint and Total the defaults**

## Diagramming S/Type Constraints

SSTYPE

23

**CONSTRAINTS (3 cases):**

1. **Exclusive** or **disjoint subtypes** – X
2. **Exhaustive** or **Total** on the *supertype* – T
3. **Exhaustive** or **Total** on the *subtype* – T<sub>b</sub>

e.g., MAN, WOMAN, CHILD

e.g., OVIPAROUS, MAMMAL, BIRD, FISH

## S/Type Constraints - Other Notations

SSTYPE

24

	<u>Exclusive</u> or <u>disjoint</u>	<u>overlapping</u>	<u>Exhaustive</u> or <u>Total</u>	<u>Partial</u>
<b>NIAM</b>	(X)		(T)	
<b>ORM*</b>	(X)	(default)	(•)	(default)
<b>EER</b>				
<b>IE</b>				
<b>UML</b>	(explicit English labels on the S/Type arcs)			
<b>ODL</b>				
<b>IDEF1X</b>				
<b>*combined</b>	(X)			

**NOTE:** No modeling schemes or systems recognize totality on the subtype.

## ⊆ "Well-Defined" Subtypes

SSTYPE

25

- based on an attribute of the supertype
  - called the "distinguishing" attribute
- characteristics of the relationship determine the constraints on the subtypes
  - mandatory attribute => exhaustive/totally constraint
  - single-valued attribute => exclusive subtypes constraint

The diagram illustrates a supertype/subtype relationship. 'Patient' is the supertype, with 'Male' and 'Female' as subtypes. 'Sex' is an attribute of 'Patient' with a value set {M, F}. A 1:M relationship is shown between 'Sex' and 'Patient'. A dashed line between 'Male' and 'Female' contains 'T' and 'X', representing constraints.

- What if an optional attribute?
- What if a multi-valued attribute (M:N relationship)?

## ⊆ Subtype Definition

SSTYPE

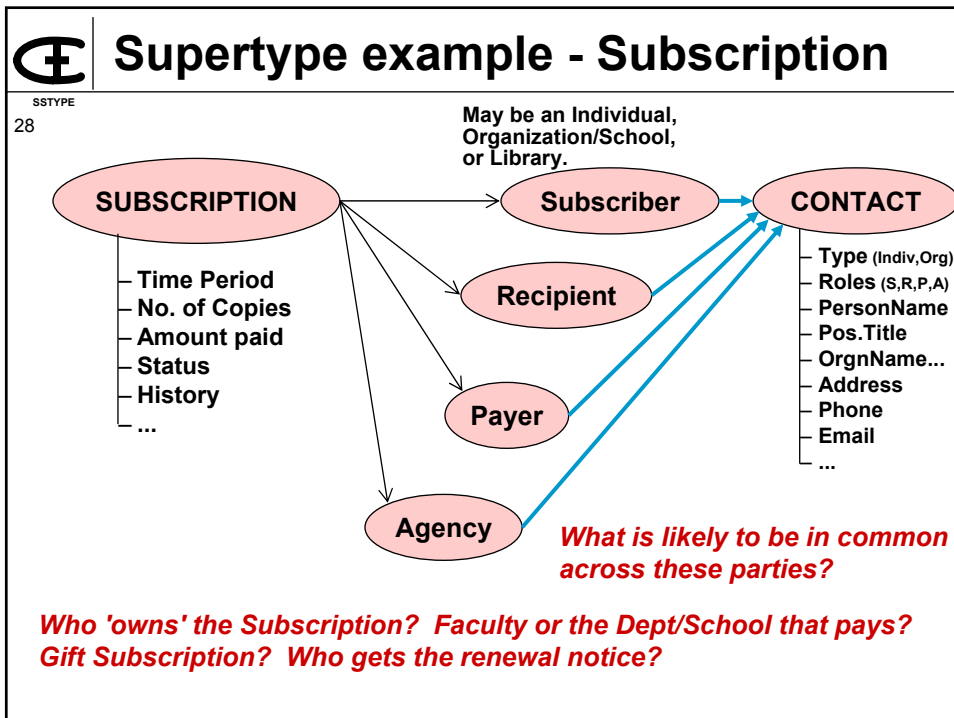

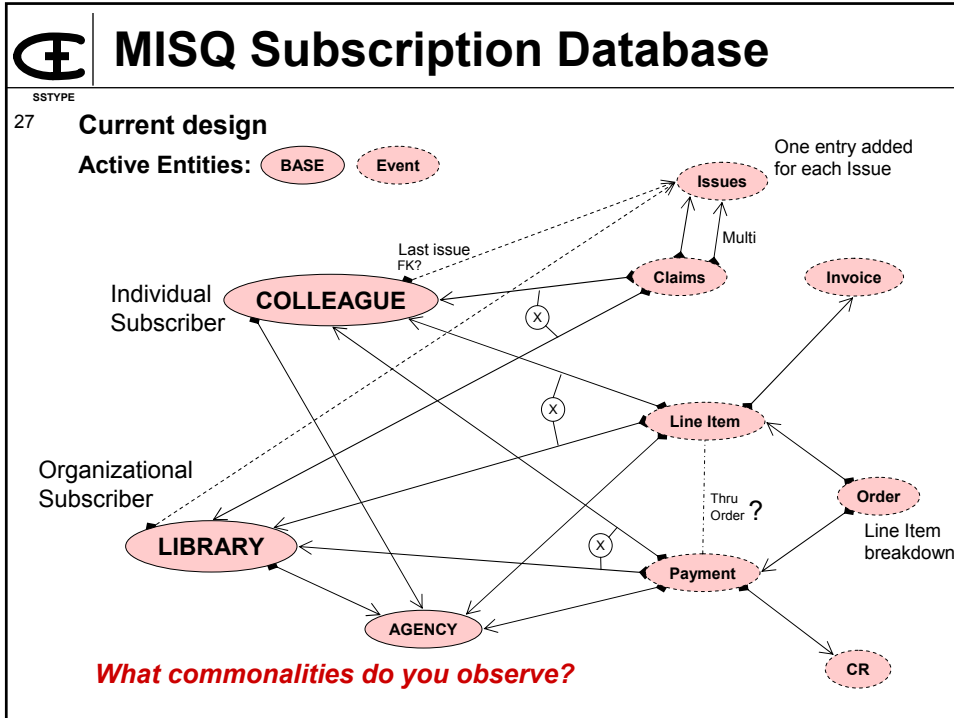

26

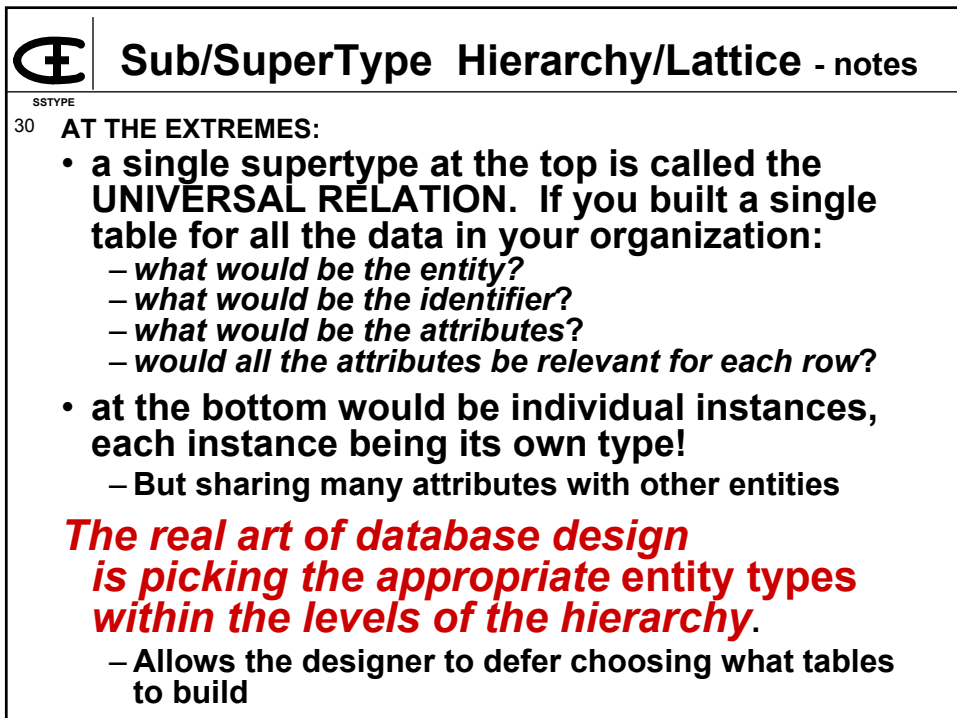

### Attribute-Defined Subtype (Intentional Set)

- a rule for including a Supertype instance in the Subtype
- Defined in terms of the values of a supertype attribute
- in general, a Boolean expression on attribute(s) of the supertype
- can be considered a *constraint* rule on subset membership
- there are many possible subgroupings (specializations) of an entity type based on the values of its attributes, so find those that matter.
- it is not always possible to define the rules for membership in a subtype, hence:

### User-Defined Subtype (Extensional Set)

- inclusion determined by "existence" in the set; membership is manual, the system cannot automate or validate membership.
- Some systems *require* subtype definitions such as *VisioEA* (but... as free-form text!)
- Can always come up with an artificial distinguishing attribute

⊆

## Single vs. Multiple Inheritance

SSTYPE

31

- **SINGLE** - every subtype has only one supertype  
=> a strict Hierarchy of types
- **MULTIPLE** supertypes for a (Shared) Subtype
- If multiple supertypes, they must converge on one population higher up = the root type  
=> a lattice.

so what is wrong/incomplete with:

- no lattice if no overlapping subtypes
- it is possible to transform multiple inheritance to a generalization hierarchy by defining all possible combinations of subtypes
- each mini hierarchy or lattice has a root, all root objects are disjoint.

```

graph TD
    Sup((Sup)) --> sub((sub))
    Sup2((Sup2)) --> sub
    
```

⊆

## Extreme Entity Generalization

SSTYPE

32

© ROBIN WADE, 1990

**“The level of generalization is critical.”** - Graeme Simsion

What is the ‘THING’?

E
Inheritance and Reuse

SSTYPE

33 • **Separate but related notions - often confused** (C. Date got it right)

**DESIGN NOTION** based on characteristics of populations:

- **Multiple populations with some different characteristics sharing some common characteristics, ... so define a supertype (generalization).**
- **Need for special treatment of a subset of a population ... so define a subtype (specialization)**
  - Subtype inherits common characteristics from its supertypes plus has some additional characteristics of interest

**CONSTRUCTION - implementation efficiency => REUSE**

- **Inheritance of definitions of data and procedures**
  - for efficiency of implementation

SOLVING PROBLEMS:

- **overriding and blocking**
- **static** (copy at creation time only),  
vs. **dynamic** (maintain linkage to automatically inherit changes)
- **multiple inheritance => conflict, priority order**

E
Comparing Modeling Schemes

SSTYPE

34

	ER/Rel (Chen)	EER (Teorey**)	ORM (Halpin)	UML (OMG)	ODL (ODMG)	SQL 1999
<b>Class Hierarchy</b>	X	Y	Y	Y	Y	Y
<b>Disjoint*</b>		Y	Y	default	only	only
<b>Overlapping</b>		default	default	Y	X	X
<b>Total covering*</b>		Y	Y	user-defined	on abstr.class	partly
<b>Partial</b>		Y	Y	Y (incomplete)	Y	Y
<b>Attribute-defined discriminator</b>		Y	'must' but...	limited (pseudo attrib)	X	X
<b>Shared Subclasses (multiple inheritance)</b>		Y	Y	Y	X	X

\*the more restrictive case, calling for a constraint declaration.

## ☒ Mapping to (Relational) Tables

SSTYPE

35 **THREE BASIC CHOICES:**

- Supertype only:**  
 (Absorption - 'flatten' up)
 

$\underline{K}_P \ D \ \{ P_i \} \dots \{ A_i \} \dots \{ B_i \} \dots$
- Subtypes only:** (not possible in VisioEA)  
 (Separation - 'flatten' down)
 

$\underline{K}_A \ \{ P_i \} \dots \{ A_i \} \dots$

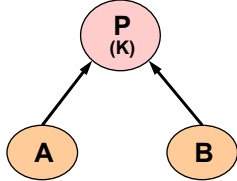

$\underline{K}_B \ \{ P_i \} \dots \{ B_i \} \dots$
- Both:**  
 (Partition)
 

$\underline{K}_P \ D \ \{ P_i \} \dots$

$\underline{K}_A \ \{ A_i \} \dots$

$\underline{K}_B \ \{ B_i \} \dots$

**GIVEN:** Halpin<sub>01</sub>, p.426.

**CONSIDER:**

- D = Distinguishing Attribute on P  
(optional)  
(single-valued?)
- Exclusive: on A & B  
- A & B overlapping
- Exhaustive (Total):  
P in neither A or B

**PROBLEMS:**

- Redundancy
- Incomplete
- Querying

## ☒ Inheritance - Three Kinds: .....>

OODBMS
