and College of Continuing Education  
University of Minnesota

  
ORMINTRO

## NIAM/ORM Teaching Experiences

2

**THE COURSE:**

- Advanced Database Design & DBAdministration
- Taught NIAM modeling since 1975, but inadequate

**NEEDED:**

- **Written Teaching Materials**  
*Conceptual Schema and Relational Database Design,*  
Nijssen & Halpin, Prentice-Hall (Australia), 1989; 2e 1995.  
*Information Modeling and Relational Databases,*  
Halpin, 2001, Morgan Kaufman.
- **Data Modeling CASE Tool**  
*InfoDesigner* from ServerWare, 1993  
*InfoModeler* from Asymetrix, 1994; then InfoModelers, Inc.  
*VisioModeler* from Visio, (Enterprise 5.0) acquired 1998, released 1999  
acquired by Microsoft, 1999/11.  
*VisioEA*, part of Visual Studio.net EA edition, released 2002/2

	<h2>NIAM / ORM Data Modeling</h2>
<small>ORMINTRO</small> 3	<p style="text-align: center;"><i>What's in the Name?</i></p> <p><b>N</b>ijssen --- Natural language <b>I</b>nformation <b>A</b>nalysis <b>M</b>ethod or <b>O</b>bject <span style="color: red;"><i>NOTE: Has no relationship with Object-Oriented ____.</i></span> <b>R</b>ole, <b>R</b>elationship <b>M</b>odeling <span style="margin-left: 100px;">also: Binary-Relationship or just Binary</span></p>

	<h2>Outline</h2>
<small>ORMINTRO</small> 4	<p>Roadmap for this presentation:</p> <ol style="list-style-type: none"><li>1. <b>Data Modeling</b><ul style="list-style-type: none"><li>– ER (most general) =&gt; Relational Modeling</li><li>– Problems with Record-based modeling</li></ul></li><li>2. <b>Transitioning from ER/Relational to ORM</b></li><li>3. <b>Modeling steps in ORM</b><ul style="list-style-type: none"><li>– Verbalize - elementary fact sentences</li><li>– Symbolize - ORM data model diagram</li><li>– Add Constraints</li><li>– Abstracting a data model diagram... for presentation</li></ul></li><li>4. <b>Place of ORM in a Taxonomy of Data Modeling Schemes</b></li><li>5. <b>Summary and Reprise</b></li></ol>

Ⓔ

## Logical Database Design

### Objective, Principles, Benefits

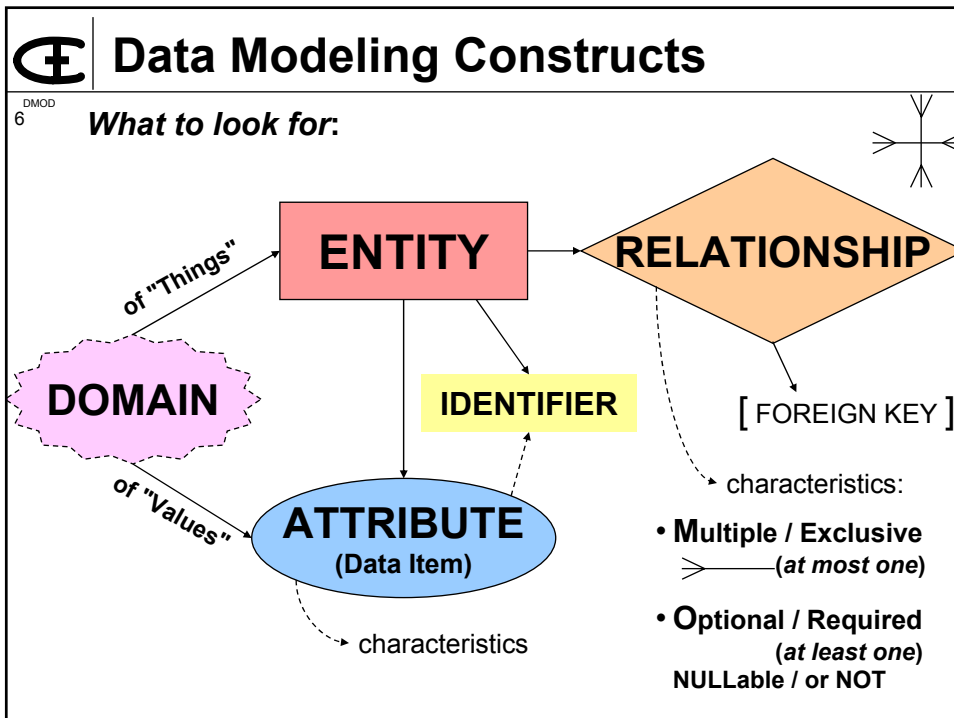

DMOD  
5

**OBJECTIVE of LOGICAL DATABASE DESIGN:**

**TO ACCURATELY AND COMPLETELY MODEL  
SELECTED PORTIONS OF THE REAL WORLD  
OF INTEREST TO A COMMUNITY OF USERS.**

- **USERS (COLLECTIVELY) WILL ALWAYS KNOW MORE ABOUT A DATA STRUCTURE THAN THE SYSTEM KNOWS, OR THAN COULD BE DEFINED TO THE SYSTEM.**
- **WHAT IS NOT FORMALLY DEFINED TO THE SYSTEM, THE SYSTEM CANNOT MANAGE . . . THE USERS MUST!**
- **THEREFORE, NEED TO CAPTURE RICH SEMANTICS WITH COMPREHENSIVE DATA MODELING and DEFINITION, INCLUDING INTEGRITY CONSTRAINTS AND OPERATIONS.**

**Let the 'system' do it!    Implications for a Tool!**

⊕

## Data Modeling Constructs

DMOD  
7

*Relative emphasis differentiates Data Modeling Schemes:*

- **ER modeling** focuses on  
**Entities and Relationships**,  
de-emphasizing, even hiding Attributes.
- **Relational (restricted ER)** focuses on  
**Entities and Attributes** (single valued),  
relegating Relationships to Foreign Keys.
- **Object Role Modeling (ORM)** focuses on  
**Objects/Domains and (Roles in) Relationships**

⊕

## Representing a M:N Relationship

DMOD  
8

**Another Pattern:**

```

graph LR
    EMPLOYEE <--> PROJECT
            
```

- If you cannot store multiple Projects (or Project IDs) in an Employee record, or multiple Employees (or Employee IDs) in a Project record (as is the case in a Relational Database), then ... you *must* introduce an "Intersection Entity" between them to represent the Many-to-Many Relationship.

```

graph TD
    EMPLOYEE --- I[EMPL-ID | PROJ-ID]
    PROJECT --- I
            
```

- The Intersection Entity also provides the place to store additional attributes of the relationship e.g., Hours Worked, Rate of Pay, ...

*What is the IDentifier? Where store attributes if 1:M?*

*What is the problem with this representation?*

## ☒ Representing a Ternary Relationship

9 DMOD

While we can develop a consistent notation for binary relationships, ternary relationships are a problem. Sample EER (Teorey) notation:

- If one of the entities is single valued, is it really ternary? Or “attributed” binary?
- What lends uniqueness to each instance of the relationship?
- How to verbalize the relationship? Which order?
- How to represent Multiplicity / Exclusivity ?
- How to represent Dependency? Must have all 3?

## ☒ Record-Based Modeling Ex.1 G

10 ORMVER

**GIVEN TWO FACTS (conceptually):**

- one about the CITY a PERSON *lives in*
- another about the CITY a PERSON *works in*

**ASSUME:**

- every person has to live and work in a city
- each person can live and work in only one city (at a time)
- not interested in anything more about persons or cities

**EXAMPLE (a Fact Instance):**

- Gordon Everest lives in Roseville and \* works in Minneapolis

➡ **DIAGRAM A CONCEPTUAL DATA MODEL**  
– to represent this information (a database to contain these facts)

⊞

## Record-Based Data Model

Ex.2

ORM/VER  
11

for PERSON *lives in / works in* a CITY

- What is the entity and what is the attribute?
- Would it make any sense to say (to a novice layperson - a user):
  - CITY was an "attribute" of PERSON?
- Doing more than is necessary at the conceptual level

**PERSON**

PersonID [key]
LiveCity
WorkCity

- cannot have CITY and CITY as attributes of PERSON
- column/attribute name reflects " entity + role "
- CITY as an entity/object is lost (not its own table)
- what if there is a CITY where no one lives or works
- some add concept of a DOMAIN

⊞

## Object-Role Model

Ex.3

ORM/VER  
12

for PERSON *lives in / works in* CITY

**FORML** language statements:

- PERSON *lives in* CITY
- Every PERSON *lives in* some CITY
- Each PERSON *lives in* at most one CITY
- ... for *works in*

FACT

● Mandatory

← Unique →

**GE**
**Record-Based Modeling**
Ex.4 G

---

ORMVER  
13

for an additional fact:

- A PERSON *makes sales calls* in multiple CITIES

**DIAGRAM** the extended conceptual data model

- can you add an attribute "SalesCallCities" to PERSON?

**FLAT Record-Based Modeling** is even worse:

- create a new table SALESCALLS with a compound key
  - Is this a real entity in the conceptual view?

➡ **EXTEND THE OBJECT-ROLE DATA MODEL**

**GE**
**Object-Role (ORM) Data Modeling**

---

ORMINTRO  
14

**THE ESSENTIAL DIFFERENCE:**

- Three main constructs ..rolled into.. Two main constructs

Record-based modeling:

ENTITY

ATTRIBUTE

RELATIONSHIP

NIAM/ORM modeling:

? ? ? ?  
*What to call it?*  
 ENTITY  
 OBJECT  
 DOMAIN  
 ENTIBUTE!

Role in  
 RELATIONSHIP

## Record-based Design

B

ORMVER  
15

### WHAT DOES THIS "RECORD" REPRESENT?

ENTITY:

<u>X</u>	A	B	C
----------	---	---	---

Design minimal "records" with *at most one* non-key domain.  
Remedy for Normal form violations is Decomposition. This is the ultimate end of Record Decomposition.

<u>X</u>	A
----------	---

Now what do these "records" represent?  
Perhaps Codd was right in naming it a \_\_\_\_\_!

<u>X</u>	B
----------	---

Avoids spurious associations, e.g., A – B ...  
Could there be any violations of normal forms?

<u>X</u>	C
----------	---

What about representing the entity **X**? or any domain?  
What if **A** is related to other "entities"?

## ER / Record-based Modeling

DMOD  
16

↓

ID

↓

ATTRIBUTES ...

↓

↓

... roles

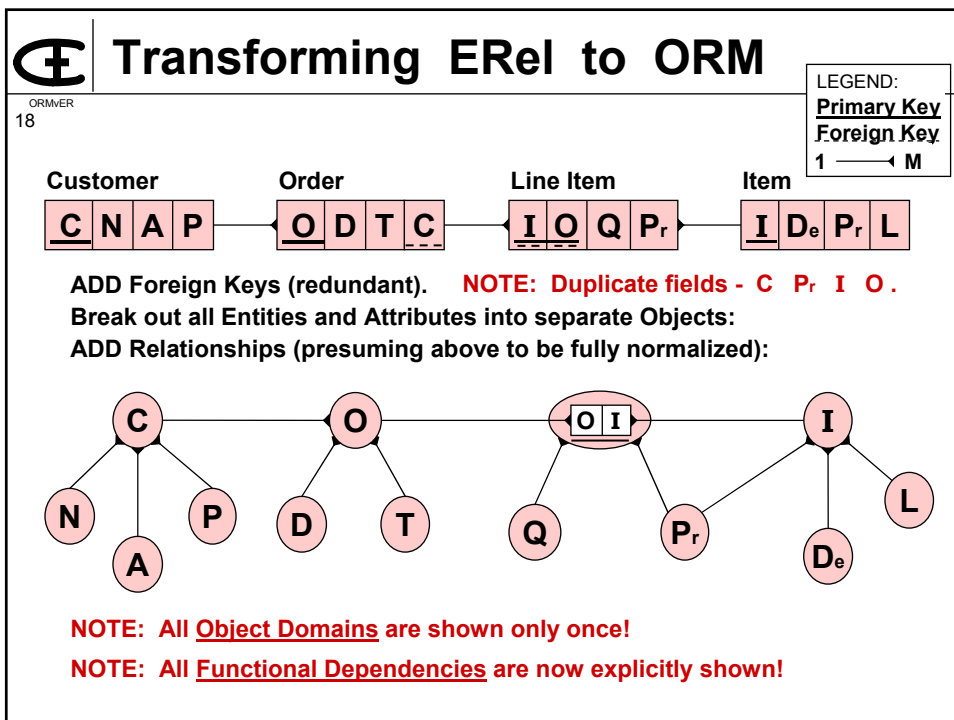

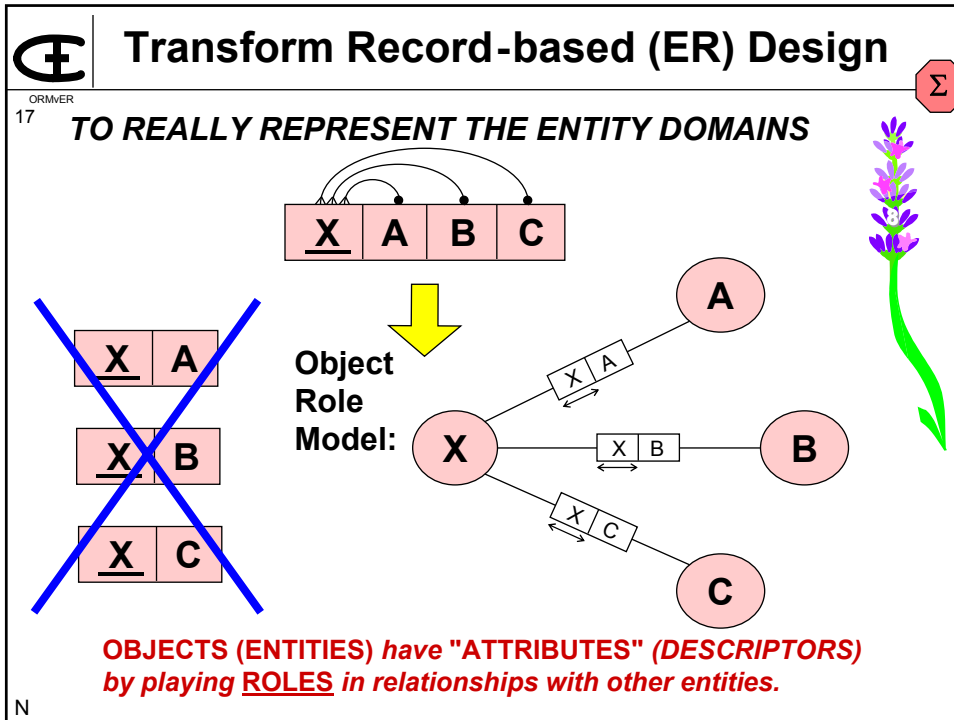

TABLE:

<u>X</u>	A	B	C	D

**CLUSTERING of ATTRIBUTES into RECORDS/RELATIONS**

- NOT a necessary or desirable first step
- gets us into trouble: if too much, must decompose to normalize

E

## Data Modeling in ORM

G
G

ORMVER  
19 Try it yourself, starting with =>  
Modify / extend the diagram with these semantics:

For each X:

1. A is **REQUIRED**
2. A is **UNIQUE** for all X
3. A is **MULTIVALUED**
4. A is **INDEPENDENT**  
i.e., can be **ORPHAN**

Also:

5. B is **FUNCTIONALLY DEPENDENT** on A
6. B and C are **RELATED**
7. D is an **ATTRIBUTE** of A

**NOTE:**

- No "Attributes"
- No 'table think'
- No Foreign Keys
- No Normalization
- Focus on Object Domains
- Think *all* Relationships

N

E

## Data Modeling Terminology

ORMINTRO  
20

	<u>O-R</u> ("conceptual")	<u>E-R</u> ("logical")	<u>COBOL/DBTG</u> <b>"NETWORK"</b> ("physical" implementation)	<u>RELATIONAL</u>
<div style="display: flex; align-items: center;"> <div style="border: 1px solid red; border-radius: 50%; padding: 5px; margin-right: 10px;"> <b>FACT SENTENCE</b> </div> <div style="display: flex; flex-direction: column; gap: 10px;"> <div style="display: flex; align-items: center;"> <div style="margin-right: 5px;">↗</div> <div style="color: red; font-weight: bold;">OBJECT</div> </div> <div style="display: flex; align-items: center;"> <div style="margin-right: 5px;">↘</div> <div style="color: red; font-weight: bold;">PREDICATE</div> </div> <div style="margin-top: 10px;"> <p style="margin: 0;">Reference Mode</p> </div> </div> </div>	<p style="margin: 0;"><b>ENTITY</b> (TYPE)</p> <p style="margin: 0;"><b>ATTRIBUTE</b></p> <p style="margin: 0;"><b>INSTANCE</b></p> <p style="margin: 0;"><b>IDENTIFIER</b></p> <p style="margin: 0;"><b>RELATIONSHIP</b></p> <p style="margin: 0;"><b>CONSTRAINT</b></p>	<p style="margin: 0;"><b>RECORD TYPE</b></p> <p style="margin: 0;"><b>DATA ITEM</b> (ELEMENT)</p> <p style="margin: 0;"><b>RECORD</b></p> <p style="margin: 0;"><b>IDENTIFIER</b></p> <p style="margin: 0;"><b>CODASYL "SET"</b></p>	<p style="margin: 0;"><b>RELATION,</b> or <b>TABLE</b></p> <p style="margin: 0;"><b>COLUMN,</b> or <b>FIELD</b></p> <p style="margin: 0;"><b>ROW,</b> or <b>TUPLE</b></p> <p style="margin: 0;"><b>KEY</b></p> <p style="margin: 0;"><b>FOREIGN KEY</b></p> <p style="margin: 0;"><b>CONSTRAINT</b></p>	

	<h2>ORM - Digging a little deeper</h2>
ORMODLG 21	<p>THE PROCESS: Familiarize &gt; Verbalize &gt; Symbolize</p> <ul style="list-style-type: none"> <li>• <b>Gather evidence from User domain</b> <ul style="list-style-type: none"> <li>– look at forms, reports, files</li> <li>– what users say; what users do</li> </ul> </li> <li>• <b>Transform into Elementary Facts</b></li> <li>• <b>Discover Objects (nouns) and Relationships (verbs)</b></li> <li>• <b>Document findings in:</b> <ul style="list-style-type: none"> <li>– <b>Elementary fact sentences</b></li> <li>– <b>ORM Data Model Diagram</b></li> </ul> </li> </ul>

	<h2>Elementary Fact Sentences</h2>	
ORMODLG 22	HALPIN01-p.61.	
<b>ENGLISH GRAMMAR - Structure of a Sentence:</b>		
<p>SUBJECT + PREDICATE [ + OBJECT ]</p> <p style="text-align: center;">↓                    ↓                    ↓</p> <p style="text-align: center;">NOUN                VERB                NOUN</p>		
<i>Elementary Fact -- cannot be decomposed into pieces which collectively provide the same information as the original fact.</i>		
	=> UNARY	
George	<i>runs.</i>	
George	<i>runs to the store.</i>	=> BINARY
George	<i>likes to run.</i>	
NOT: George	<i>likes to run <u>and</u> jump.</i>	
George	<i>does <u>not</u> like to run.</i> ... CLOSED WORLD ASSUMPTION	
George and Mary	<i>like to run.</i> ... <b>together!</b>	
<i>If George <u>runs</u>, <u>then</u> Mary runs.</i>		
<i><u>All</u> people who <u>run</u> are happy!</i> ...HANDLED WITH ROLE SET CONSTRAINTS		

## Symbolize: ORM Constructs

---

ORMODLG  
23

- **OBJECT** (ENTITY, CONCEPT) - noun ... in an ellipse
- **PREDICATE** (RELATIONSHIP) - verb ... in a box  
= *role name(s)*.  
– one or more roles: unary, binary, ternary, +++

**Elementary Binary Fact Sentence (schema):**

**Verbalization:** (both ways)

*“PERSON works in DEPARTMENT”*

*“DEPARTMENT employs PERSON”*

## Exercise – ORM Diagrams

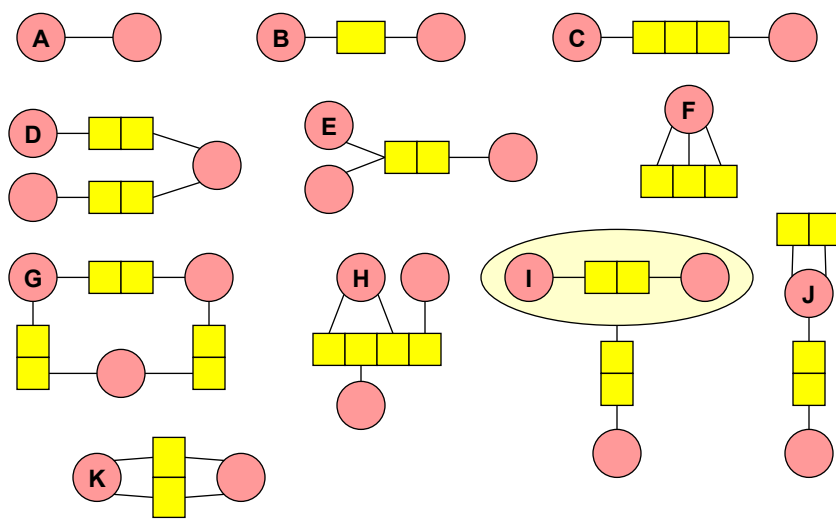

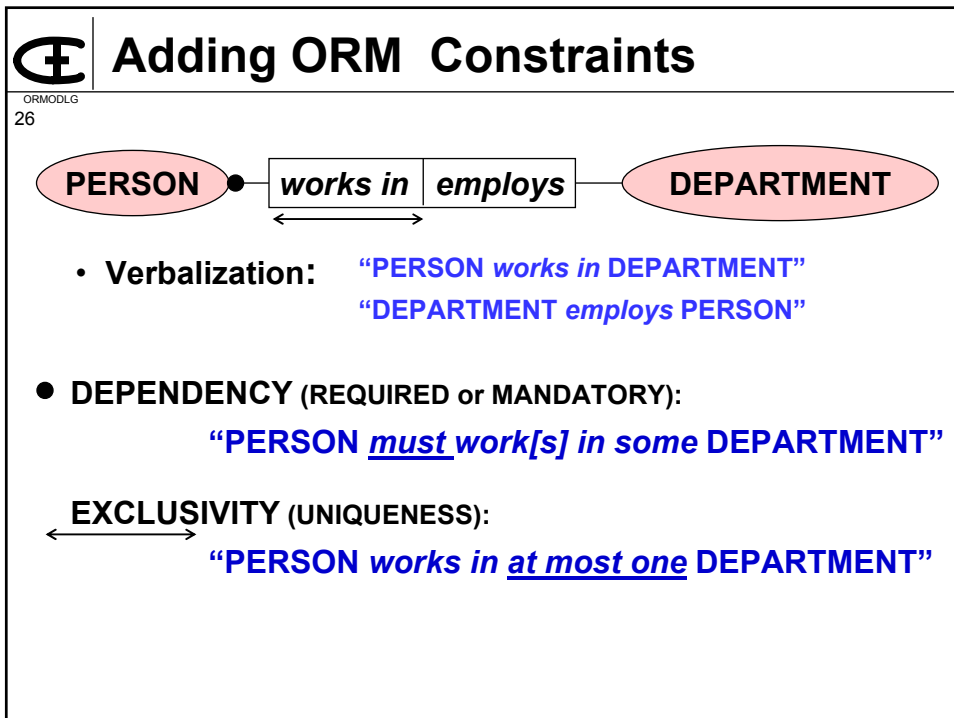

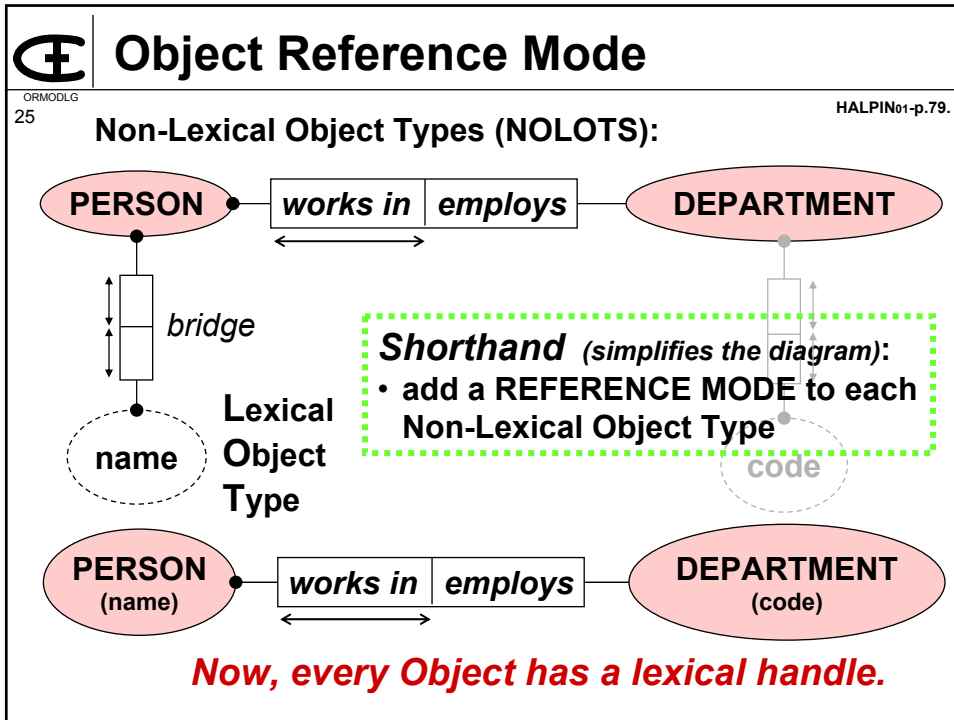

---

ORMODLG  
24

**Find the illegal ORM Diagrams; explain why:**

HALPIN01-Ex.3.4-7, p.92.

E

## Uniqueness Constraint

ORMCON 27

- to represent the exclusivity / multiplicity characteristic of a relationship (ER focuses on the Entities)
- ORM focuses on the Elementary Fact Sentence, so... construct a 'fact table' of representative instances:

**EMPLOYEE works in DEPARTMENT**

Peterson	2000
Lynn	2000
Carr	2100
Callagan	2100
Guttman	2110
:	:

- Put a line across the role(s) that make the predicate unique:

An EMPLOYEE can participate in the relationship with DEPARTMENT at most once.

E

## Uniqueness Constraints - Exercises

G

ORMCON 28

- The keys for certain fact types are as shown. On this basis, which of these fact types are definitely splittable? – Halpin<sub>01</sub> §4.5, p.151

(a)

(b)

(c)

(d)

(e)

(f) Okay?

(g)

(h) Why not?

RULE:

## Mandatory Role Constraint

ORMCON 29 Halpin01-\$5.2.

- the **Optional / Dependent** characteristic of a relationship
- also called: - **total role constraint** (other notations:  $\forall$  (T) )  
- **exhaustibility**

– every EMPLOYEE *must* work for some DEPARTMENT.

- **Disjunctive mandatory:**

- **External Disjunctive Mandatory:**

## Ternary++ Relationship Nested 'Objectified' Predicate/Fact

ORMODLG 30 HALPIN01-p.85.

*What is wrong with this?* *Must have a Grade*

*What about this?* *In "Table Think" what is the first question you ask?*

**CONTRIBUTION:**

DATE	AMOUNT	FUND
------	--------	------

*ORM gives an explicit means to analyze and record higher order relationships.*

⊕

Value Set Constraint

ORMCON  
31
Halpin<sub>01</sub>-§6.3,p.220.

**On the Population of an Object, defined by:**

- Enumeration - { M , F } {.....}
- Range (if an ordering) – { 1 ... 10 } Object
- Pattern of Characters –
  - e.g. { a15} = 15 alpha characters
  - e.g. { d6.d2 } = up to 6 digits followed by 2 digits after a decimal point
- Reference Entity (Table)
  - to contain all possible values of the Entity, even if not used elsewhere in the database.
  - Declare the Entity as 'Independent' to allow for orphans, e.g., ... SKILL !

⊕

Frequency Constraints

ORMCON  
32
Halpin<sub>01</sub>-§7.2,p.278.

- **Role Frequency**
  - Limits the number of times an object can play a role; or the number of times a role (or role combination) can appear in a fact table.
  - Place on the role(s) of the Predicate:
    - an 'n' or a range
    - optionally, with comparator operators ( <, >, ...)
    - or a Range - (min ... max)
- **Object Cardinality** (indirect in *VisioEA* thru Value Set)
  - Limits the size of an Object Population

```

graph LR
    EMPLOYEE --- works_on[works on]
    EMPLOYEE --- contains[contains]
    COMMITTEE --- contains
    works_on --- contains
    style works_on width:100px,height:20px
    style contains width:100px,height:20px
    style EMPLOYEE fill:#f9d5e5,stroke:#333,stroke-width:1px
    style COMMITTEE fill:#f9d5e5,stroke:#333,stroke-width:1px
    
```

Not in Record-based modeling schemes!

E

## Role Population Constraints

ORMCON 33

Halpin<sub>01</sub>-§6.4,p.229.

- Applies at the type level, on whole populations
- Only consider if *both* roles are optional
- Only apply when roles are on the *same* entity type population.

May also apply to the tuple populations (both roles in predicate) or to ternary predicates.

**EQUALITY**

R1 IFF R2

R1 ↔ R2

pop(R1)=pop(R2)

**SUBSET**

If R2, then R1.

R2 → R1

pop(R2)≤pop(R1)

**EXCLUSION**

If R2, then -R1 and vv.

pop(R1)^pop(R2)=NULL

Not in Record-based modeling schemes!

E

## Ring Constraints

ORMCON 34

Halpin<sub>01</sub>-§7.3,p.283.

**on a Reflexive Relationship**  
(Ring Fact Type, Homogeneous Predicate)

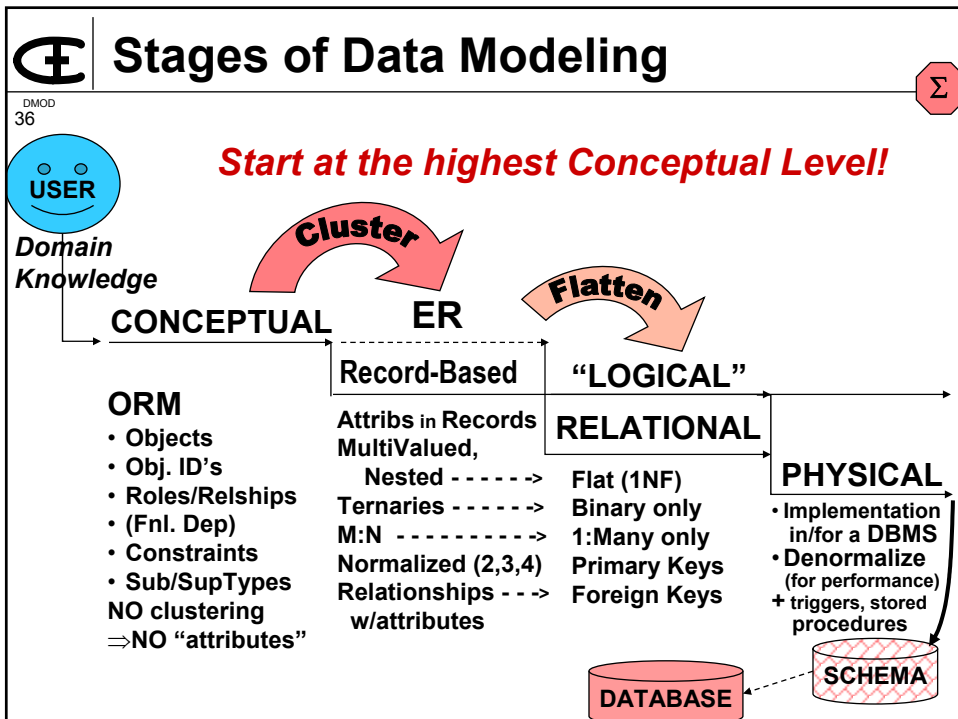

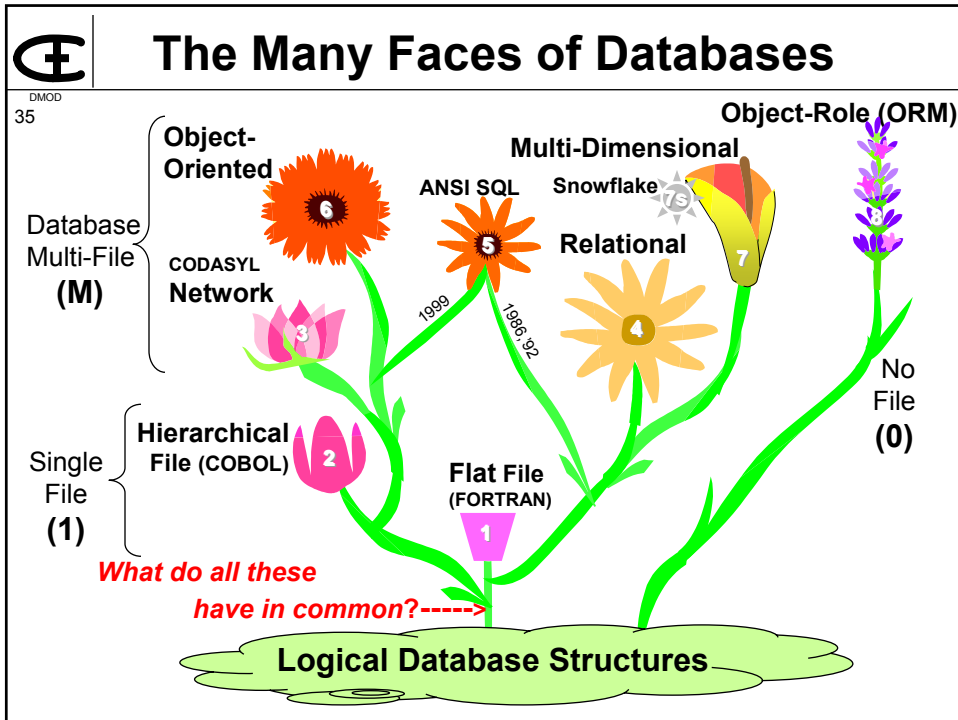

EXAMPLES:

- PERSON ----- *parent of* | *child of* ----- PERSON (M:M)
- PERSON ----- *mother of* | *child of* ----- PERSON (1:M)
- PERSON ----- *husband of* | *wife of* ----- PERSON (roles, NOW or EVER)
- DEPARTMENT ---- *reports to* | *oversees* ---- DEPARTMENT

ACyclic  
InTransitive  
WHICH ALSO IMPLIES  
ASymmetric  
IRreflexive

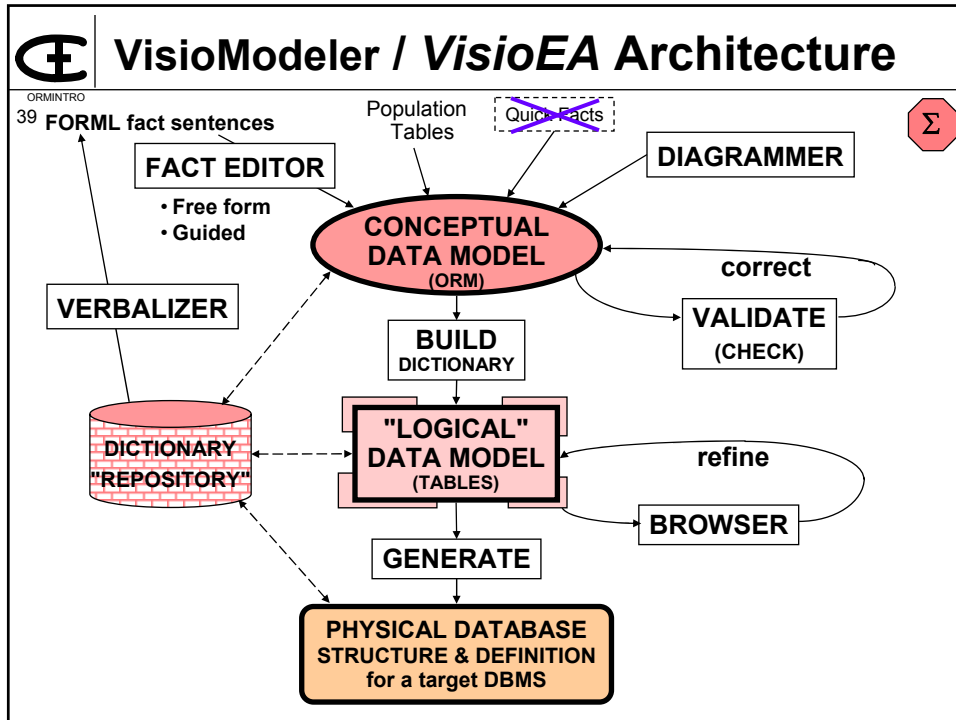

All possible relationship combinations are allowed unless Ring Constraints are declared.

Not in Record-based modeling schemes!

	<h2>Problems with ER Modeling - Summary</h2>
	<div style="display: flex; justify-content: space-between;"> <div style="writing-mode: vertical-rl; transform: rotate(180deg); color: red; font-weight: bold;">             All a consequence of clustering !           </div> <div style="width: 80%;"> <p>ORMER 37</p> <ul style="list-style-type: none"> <li>• Cannot capture the "conceptual" view directly, Must <i>mentally</i> map to the "logical" (record-based) view by clustering Attributes into Entity records/tables.               <ul style="list-style-type: none"> <li>- Modeler must <i>a priori</i> choose whether Entity or Attribute</li> <li>- Too much clustering; attributes in the wrong place</li> <li>- Ignores (or presumes normalized) intra-record structure (that is, relationships between/among Attributes)                   <ul style="list-style-type: none"> <li>- creates (implies) spurious inter-attribute relationships</li> </ul> </li> </ul> </li> <li>• Human modeler is responsible for normalization remedy is <i>always</i> record decomposition</li> <li>• Must choose unique names               <ul style="list-style-type: none"> <li>- for attributes in a record; for spurious new "entities"</li> <li>- column names = domain + role; lose object domains</li> </ul> </li> <li>• Modeling / Processing dilemma:               <ul style="list-style-type: none"> <li>- Complete representation of an entity object - more clustering</li> <li>- Full normalization (1NF) – decomposition, more fragmentation</li> </ul> </li> <li>• Indirect representation of M:N relationships</li> <li>• Difficulty representing Ternary relationships</li> <li>• Stability of the query language (SQL)</li> </ul> </div> <div style="writing-mode: vertical-rl; transform: rotate(180deg); color: red; font-weight: bold;">             All are solved in ORM !           </div> </div>

	<h2>Why NIAM/OR Modeling?</h2>
	<div style="display: flex; justify-content: space-between;"> <div style="width: 80%;"> <p>ORMINTRO 38</p> <ul style="list-style-type: none"> <li>• roots in both LOGIC &amp; LINGUISTICS</li> <li>• based on one modeling construct: the fact sentence</li> <li>• more expressive, understandable - diagrams &amp; verbalization</li> <li>• more, richer semantics in the diagram (than E-R, EER, IDEF1X)</li> <li>• capture and represent all functional dependencies =&gt;avoids normalization problems with record-based modeling</li> <li>• diagrams can be populated with actual data samples</li> <li>• more stable under changes to the application domain</li> <li>• abstraction levels equivalent to E-R modeling</li> <li>• better meets criteria for good data modeling</li> <li>• organizations that switched wouldn't go back to E-R</li> <li>• direction of Standards (SUMM, UDM, Express, OMG-Busn Rules...)</li> <li>• now supported with a viable PC-based CASE tool</li> </ul> </div> </div>

**What's Done in ORM?**

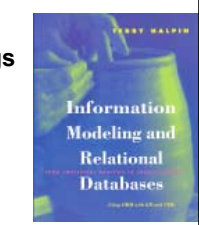

ORMINTRO 40

that is different than in ER/Relational modeling:

- Uses two constructs, **OBJECT** and **ROLE/Relationship**, rather than three as in ER: Entity, Attribute, Relationship
- Elementary **FACT SENTENCE** is the basic construct  
**OBJECT** = Subject, Object (noun)  
**RELATIONSHIP** = Predicate (verb)  
hence can directly *verbalize* a data model, including all the constraints in the model diagram
- Represents *all* **DOMAINS** directly (Entity, Value)
- Explicitly represents *all* **Relationships** including all Functional Dependencies.

	<h2>Resulting Benefits of ORM</h2>
<small>ORMINTRO</small> 41	<p><b>Benefits over <i>all</i> record-based modeling schemes:</b> (ER, EER, IDEF1X, IE, Barker, Relational, SOM, OO, UML, ...)</p> <ul style="list-style-type: none"> <li>• <b>No need to determine <i>a priori</i> if something is an entity or an attribute (i.e., will have its own Table)</b></li> <li>• <b>Avoids the traps of "Table Think"</b></li> <li>• <b>Direct, unambiguous representation of higher-order relationships (ternary, ++)</b></li> <li>• <b>Can represent more, richer semantics and constraints in a data model diagram</b></li> <li>• <b>Can automatically generate the relational data model</b></li> <li>• <b>Generates a fully normalized relational data model</b></li> </ul> <p><b>NO disadvantages for "conceptual" data modeling</b> (ER, record-based, high-level "logical" data modeling)</p>

	<h2>Why Not NIAM?</h2>
<small>ORMINTRO</small> 42	<p><i>If NIAM/OR modeling is superior why is it not more popular and widely used; why the lack of support?</i></p> <ul style="list-style-type: none"> <li>• <b>Few academics involved</b></li> <li>• <b>CDC kept it proprietary - in Europe and USA</b></li> <li>• <b>Lack of strong vendor support</b></li> <li>• <b>Too detailed; bottom up design - NOT!</b></li> <li>• <b>Lack of support for mental chunking and Levels of Abstraction - NOT!</b> <ul style="list-style-type: none"> <li>– ENTITIES, ATTRIBUTES, VALUES (LOTS), RELATIONSHIPS are all represented the same way. Diagrams should give visual prominence in proportion to semantic importance.</li> </ul> </li> </ul>

	<h2>Resources on ORM</h2>
